

Tasks: sourcing fuseholders and multiple pin connectors connectors,
Working on battery monitoring for rover testing

Fuseholders have been sourced and have a high current rating with around 12AWG wire gauge
Issue while searching for these was price of the fuseholders which went over 1000rs for the
current rating and wire gauge we looked at
Solved issue by searching extensively the least price per unit was 164.76rs on amazon while it
is 300rs on mouser

connectors are still being sourced and there are a lot of options on molex which are all available
on mouser

There are different categories for different pitches and current ratings:

Pico is usually 1.25 to 1.5mm pitch

Milli are 2mm

And mini are usually 2.5mm

There are more categorizations like their locking systems

Inner positive lock

Outer positive lock

Friction lock

These then have different connector systems which have different current and wire gauge
ratings

There are also series which can handle a lot of current

These are the mx150 and mx120 series which can also be used as a replacement of the
amphenol to reduce weight as these have a plastic housing

There are many different types of connectors by molex which are present on mouser.

A problem that molex solves is that they have application pdfs for connectors which show
pictures of how the connector is used

No sufficient work was done on the bms, the problem remains that there are not enough adc
pins on the stm32 board to monitor all the batteries and a solution has yet to be found
